The promoter is then induced with IL-4 or IL-13, and the presence or absence of the reporter gene is detected. Absence of the reporter gene indicates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the nucleotide sequence of Ahhhh survival construct comprising an inducible epsilon promoter-chimeric Fas (either CD8 or mLyt2)-TRES-hydromycin-bovine growth hormone poly-A tail placed in vector Cl2s backwards so that no leaky transcription occurs through the CMV promoter. It is an example of a death gene that provides a nucleic acid that encodes a protein which causes a cell to die. The death gene can be used as a reporter gene in methods of the invention used to screen for modulators of IgE synthesis, secretion and switch rearrangement. The method

The present sequence is that of survival construct Ahhhh in which the interleukin-4 inducible epsilon promoter-chimeric Fas(CD8 or mLyt2)-internal ribosome entry site-hygromycin-bovine growth hormone polyA tail is placed in the Cl2s vector backwards so that no leaky transcription occurs through the CMV promoter. Methods of the invention utilise diptheria toxin for screening purposes, especially for identifying modulators of IgE synthesis, secretion and switch rearrangement. A claimed method of screening for
                                                                                                                                                                                                     Screening for agents capable of inhibiting a promoter, especially interleukin-4 inducible epsilon promoter involved in immunoglobulin production, by using diphtheria toxin constructs -

bioactive agents capable of inhibiting the IL-4 inducible epsilon computer (see AAF30941), which is involved in IgE switching, comptrises: combining a candidate bioactive agent and a cell that does not endogenously express heparin-binding epidermal growth factor (HBEGF) and which comprises a fusion in uncleic acid comprising the IL-4 inducible epsilon promoter and a nucleic acid encoding HBEGF; inducing the promoter with IL-4; adding diphtheria toxin to the cell; and determining whether the cell is dead. Survival constructs carrying a death gene and a conspiculation promoter survival cell line. Inhibitors of IgE synthesis can be identified that prevent the production of IgE and reduce or cellminate an allergic response.

No. is the number of results predicted by chance to he score greater than or equal to the score of the result being and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                 US-908-02-05-102.

US-908-02-05-102.

Sequence 102, Application US/09802669

Patent No. US20020004490al

GENERAL INFORMATION:

APPLICANT: Dean, Nicholas M.

APPLICANT: Myatt, Jacqueline

APPLICANT: Thang, Hong

TITLE OF INVENTION: Antisense Compound Modulation of Fas Mediated Signaling

FILE REFERENCE: ISPH-545

CURRENT PELICATION NUMBER: US/09/802,669

PRIOR FILING DATE: 2001-03-09

PRIOR PILING DATE: 2000-09-18

PRIOR FILING DATE: 1999-04-12

NUMBER OF SEQ ID NOS: 180

SOFTWARE: Patentin. Ver. 2.0

SEQ ID NO 102

LENGTH: 836
